

MEMORANDUM

TO: Senior Operations Manager
FROM: Nickey Ombasa, Operations Data Analyst
DATE: June 29, 2026
SUBJECT: Automated Efficiency Tracking Tool & Operational Framework

Context: The Need for Automated Tracking

In managing multi-site fuel distribution depots, relying on manual data reviews creates an operational blind spot. Currently, compiling daily actual outputs against targets requires manually gathering spreadsheets, calculating percentages by hand, and subjectively determining which sites need attention. This lagging, labor-intensive approach delays leadership's ability to respond to supply bottlenecks or mechanical failures until hours or sometimes days after they occur. To sustain optimal performance, we must shift from a reactive stance to real-time, automated oversight.

What Was Built: The Automated Analyzer

To solve this, I have engineered an automated Operational Efficiency Analyzer. Think of this tool as a digital assistant that instantly takes in operational statistics, processes them without human error, and delivers a clear scorecard. Technically, it uses a collection of data and repeatedly reviews every facility one by one in milliseconds. It instantly applies a mathematical formula to determine precise capacity achievement, completely eliminating manual math.

Business Insights & Rapid Problem Identification

The core power of this tool lies in its objective Status Classifier. Instead of scrolling through columns of raw numbers, the tool automatically flags facilities using strict, standardized business rules:

Efficiency Threshold	Assigned Status	Operational Meaning & Required Action
90% or Higher	Normal	Healthy operations. No immediate action required.
70% to 89%	Warning	Minor bottleneck or underperformance. Monitor closely.
Below 70%	Critical	Severe operational disruption. Immediate action required.

Strategic Benefit: *If a facility drops to 68% due to a pump failure, a manual check might catch it at the end of the week. This automated tool flags it as Critical the second the daily data point lands, allowing you to re-route logistics immediately and protect our delivery Service Level Agreements(SLAs).*

Action & Recommended Deployment

I recommend deploying this tool directly into the Logistics & Distribution Department Operations Desk. We can establish an automated morning sequence where the tool pulls data directly at 6:00 AM daily and emails a clean, three-line text report directly to your inbox before the morning stand-up meeting. This removes the administrative burden from site supervisors, standardizes performance metrics across all regional depots, and ensures your morning decisions are backed by clean, unarguable operational facts.
